

D1 confirmatory run, n=2560 per point: 8 × 4 MIMO, QPSK, rate-1/2 (133, 171)₈, T = 16, 16 iterations

BLER exactly 0 is drawn at the $0.5/n$ floor = $1.95e-4$, not at the axis edge. The power guard is a PAIR-level verdict, so the grey bands mark the decision SNRs of the UNDECIDED pairs, not individual curve points.
